

Profiler

Trimagic Profiler is an innovative tool that automates the distribution of relevant information within an organisation. It delivers the content directly to you using email alerts so you can use it and work with it immediately.

Profiler is designed to eliminate time-consuming search and retrieval tasks. This contributes to the value that the information manager adds to the organisation by ensuring that the information delivered to users is consistent and relevant.

How does it work?

Profiler operates as an automated service that is preconfigured to access an organisation's Inmagic TextWorks or any other ODBC-compliant database.

An organisation's Information Manager simply registers a profile for an individual or workgroup, specifying their information requirements and general interest topics. Profiler then searches nominated databases and provides the latest relevant data to the end user automatically via an email alert.

What are the benefits?

Automated delivery. Finds and delivers the information that is most valuable to the end-user and enables them to interact immediately with the content.

Streamlines your workload. Eliminate hours of time spent on repetitive search and notification tasks.

Customisable templates. Create your own templates to suit your end-users needs.

Information currency. Profiler is designed to ensure end-users receive current and relevant information on nominated topics and subjects of interest.

User-friendly. Easily modify user profiles as your organisation's requirements change.

Set and forget. Once you schedule Profiler to run its searches at a specific time it will automatically start delivering the required email alerts to the end users.

Scalable. Set up an unlimited number of profiles.

What can Profiler be used for?

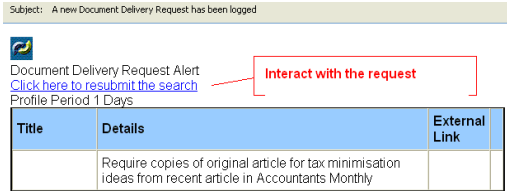

The use of Trimagic Profiler in automating your work processes and making the delivery of information more streamlined is limited only by your imagination. Profiler can automate any search.

Subject Alert. Users have subjects of interest eg a lawyer in workers compensation, a doctor in eye surgery, etc. A profile is established for this user and they will be alerted when new relevant content arrives.

Journal update alert. After the Information Centre receives journal or subscription content, Profiler automatically distributes to the users in the organisation. This means that it does not need to be manually distributed.

Document delivery/research request.

A request is submitted by a user and the information centre staff are alerted by the Profiler. Staff can interact with the request record directly from the email.

Subscription renewals. The individual responsible for subscription renewals is alerted to the list of items that are due for renewal.

Overdue loan notices. These may be automatically disseminated on a regular basis to all users.

How is Profiler Version 4 Different?

End user configuration. End users can select topics, edit the journals they receive, date ranges and search complexity.

Server based. The previous version of Profiler was managed from a workstation; this version is managed through your browser from any workstation.

Fully customised email bodies.

Connect to any ODBC data source.

Single sign on for end users (LDAP or ActiveX) i.e. no password required.

Inbuilt data integrity and error reporting.

About Trimagic Software

Information professionals have been using Trimagic software for over 20 years because our solutions are innovative and they work. We carefully consult with our clients to tailor a solution that will meet their individual needs and give them the skills necessary to take control of their system. Our applications are built on the Inmagic product platform to help you manage all your information requirements.

Product preview

The most effective way to evaluate any software is to see it in action. A Trimagic Software Consultant can visit your office or we can demonstrate our products online.
